# Open|SpeedShop Quick Start Guide

Open|SpeedShop (O|SS) is an open source multi-platform performance tool enabling performance analysis of HPC applications running on both single node and large scale Intel, AMD, ARM, Intel Phi, PPC, Power8, GPU processor based systems, including Cray and IBM Blue Gene platforms. O|SS gathers and displays several types of information to aid in solving performance problems, including: program counter sampling for a quick overview of the applications performance, call path profiling to add caller/callee context and locate critical time consuming paths, access to the machine hardware counter information, input/output tracing for finding I/O performance problems, MPI function call tracing for MPI load imbalance detection, memory analysis, POSIX thread tracing and OpenMP analysis. OISS offers a command-line interface (CLI), a graphical user interface (GUI) and a python scripting API user interface.

#### **ACCESS INFORMATION**

The O|SS Website: https://www.openspeedshop.org

O|SS Documentation, including the O|SS Users Guide: https://www.openspeedshop.org/documentation

CBTF Information: https://github.com/OpenSpeedShop/cbtf/wiki

Downloads available from: https://www.openspeedshop.org/downloads

To use O|SS, check with your system administrator to see if a module, dotkit, or softenv file for O|SS exists on your system. OISS can be installed in user directories as no root access is needed. Visit the OISS website and click on Documentation under NAVIGATION to find the install instructions.

Help email: oss-contact@openspeedshop.org. To register for access to forum questions and answers: oss-questions@openspeedshop.org

## **■ WHAT OPEN|SPEEDSHOP PRODUCES**

O|SS monitors a running application from start to finish and gathers performance data (and symbolic information describing the application), saves it to a SQLite database file and generates a report. The symbolic information allows the performance data to be viewed on another system without needing the application to be present.

#### ■ PERFORMANCE INFORMATION TYPES

Description

**Experiment** 

hwctime

OSS provides the following options, called experiments, to do specific analyses.

pcsamp	Periodic sampling the program counters gives a low-overhead view of where the time is being spent in the user application.
usertime	Periodic sampling the call path allows the user to view inclusive and exclusive time spent in application routines. It also allows the user to see which routines called which routines. Several views are available, including the "hot" path and butterfly view.
hwc	Hardware events (including clock cycles, graduated instructions, i- and d-cache and TLB misses, floating-point operations) are counted at the machine instruction, source line and function levels.

Similar to hwc, except that sampling is based on time, not PAPI event overflows. Also, up to six hwcsamp events may be sampled during the same experiment.

Similar to hwc, except that call path sampling is also included.

Accumulated wall-clock durations of I/O system calls: read, ready, write, writev, open, close,

dup, pipe, creat and others.

Same functions as io are profiled in a light weight manner. Less overhead than io, iot.

Similar to io, except that per event information is gathered, such as bytes moved, file names, etc. iot

mem\*\* Tracks potential memory allocation call that is not later destroyed (leak). Records any memory allocation event that set a new high-water of allocated memory current thread or process. Creates an event for each unique call path to a traced memory call and records the total number of times this call path was followed, the max allocation size, the min allocation size, and the

total allocation, the total time spent in the call path, and the start time for the first call.

Captures the time spent in and the number of times each MPI function is called.

Same functions as mpi are profiled in a light weight manner. Less overhead than mpi, mpit.

Like MPI but also records each MPI function call event with specific data for display using a GUI mpit

or a command line interface (CLI).

Reports POSIX thread related performance information. pthreads

Report task idle, barrier, and barrier wait times per OpenMP thread and attribute those times omptp

to the OpenMP parallel regions.

cuda\* Periodically samples both CPU and GPU hardware performance counter events. Traces all NVIDIA

CUDA kernel executions and the data transfers between main memory and the GPU. Records the call sites, time spent, and data transfer sizes.

\* CBTF mode only, not available when using the offline mode. See MODES OF OPERATION section.

\*\* The memory experiment performance data is not reduced in the manner that it is in the default mode of operation because the filters are not called during offline mode of operation.

#### ■ MODES OF OPERATION

The default version of O|SS uses a multicast reduction network to transport the raw performance information from the application to the OISS client tool. This mode of operation uses the Component Based Tool Framework (CBTF) infrastructure for better scalability and is known as the CBTF mode of operation.

The alternative mode of operation is the offline mode, traditionally referred to as the offline version. In this mode, the raw performance information is written to files on a shared file system and then processed at applications completion. To access this mode of operation use the "--offline" phrase after the convenience script name. For example: osspcsamp --offline "how you run your application normally". In general, this mode of operation can be used when high numbers of processes, threads, or ranks are not required.

#### ■ SUGGESTED WORKFLOW

We recommend an **OISS** workflow consisting of two phases. First, gathering the performance data using the convenience scripts. Then using the GUI or CLI to view the data.

#### ■ CONVENIENCE SCRIPTS

Users are encouraged to use the convenience scripts (for dynamically linked applications) that hide some of the underlying options for running experiments. The full command syntax can be found in the User's Guide. The script names correspond to the experiment types and are: osspcsamp, ossusertime, osshwc, osshwcsamp, osshwctime, ossio, ossiot, ossmpi, ossmpit, ossiop, ossmem, ossomptp, osspthreads, ossmpip, and osscuda plus an osscompare script. Note: If using the file I/O version, make sure to set OPENSS\_RAWDATA\_DIR (See **KEY ENVIRONMENT VARIABLES** section for info).

When running Open|SpeedShop, use the same syntax that is used to run the application/executable outside of O|SS, but enclosed in quotes; e.g., Using MPI drivers like mpirun: osspcsamp "mpirun -np 512 ./smg2000 -n 5 5 5" Using SLURM/srun: **osspcsamp** "srun -N 64 -n 512 ./smg2000 -n 5 5 5"

Redirection to/from files inside quotes can be problematic, see convenience script "man" pages for more info

#### ■ REPORT AND DATABASE CREATION

Running the pcsamp experiment on the sequential program named mexe: **osspcsamp** mexe results in a default report and the creation of a SQLite database file mexe-pcsamp.openss in the current directory; the report:

CPU Time	% CPU Time	Function
11.650	48.990	f3 (mexe: m.c, 24)
7.960	33.478	f2 (mexe: m.c,15)
4.150	17.451	f1 (mexe: m.c,6)
0.020	0.084	work(mexe:m.c,33)

To access alternative views in the GUI: openss —f mexe-pcsamp.openss loads the database file. Then use the GUI toolbar to select desired views; or, using the CLI: **openss –cli –f** mexe-pcsamp.openss to load the database file. Then use the **expview** command options for desired views.

#### ■ CONVENIENCE SCRIPT DESCRIPTION

## **■** osscompare: Compare Database Files

Running a convenience script with no arguments lists the accepted arguments. For the hwc scripts the accepted PAPI counters available are listed.

**osscompare** "<db\_file1>, < db\_file2>[,<db\_file>...]" [time | percent | <other metrics>] [rows=nn]

[viewtype=functions|statements|linkedobjects]>[oname=<csv filename>]

Example: **osscompare** "smg-run1.openss,smg-run2.openss"

Additional arguments for comparison metric:

Produces side-by-side comparison. Type "man osscompare" for more details.

## **osspcsamp: Program Counter Experiment**

osspcsamp "<command> < args>" [ high | low | default | <sampling rate> ]

Sequential iob example:

osspcsamp "smg2000 -n 50 50 50"

Parallel iob example:

osspcsamp "mpirun –np 128 smg2000 –n 50 50 50"

Additional arguments:

**high:** twice the default sampling rate (samples per second) **low:** half the default sampling rate **default:** default sampling rate is 100 < sampling rate >: integer value sampling rate

ossusertime: Call Path Experiment

**ossusertime** "<command> < args>" [ high | low | default | <sampling rate> ]

Sequential job example:

ossusertime "smq2000 -n 50 50 50"

Parallel job example: ossusertime "mpirun –np 64 smg2000 –n 50 50 50"

Additional arguments:

**high:** twice the default sampling rate (samples per second) **low:** half the default sampling rate

**default:** default sampling rate is 35

<sampling rate>: integer value sampling rate

## osshwc, osshwctime: HWC Experiments

osshwc[time] "<command> < args>" [ default | <PAPI event> | <PAPI threshold> | <PAPI event>

<PAPI threshold>] Sequential job example:

osshwc[time] "smg2000 -n 50 50 50"

Parallel job example:

osshwc[time] "mpirun –np 128 smq2000 –n 50 50 50"

Additional arguments:

default: event (PAPI TOT CYC), threshold (10000)

<PAPI event>: PAPI event name <PAPI threshold>: PAPI integer threshold

## osshwcsamp: HWC Experiment

osshwcsamp "<command>< args>"[ default | <PAPI\_event\_list>| <sampling\_rate>]

Sequential job example: osshwcsamp "smq2000"

Parallel job example:

osshwcsamp "mpirun –np 128 smq2000 –n 50 50 50"

Additional arguments:

default: events(PAPI TOT CYC and PAPI TOT INS), sampling rate is 100

<PAPI event list>: Comma separated PAPI event list <sampling rate>:Integer value sampling rate

# ossio, ossiop, ossiot: I/O Experiments

ossio[[p]|[t]]"<command> < args>" [ default | f t list ]

Sequential job example:

ossio[[p]|[t]] "bonnie++"

Parallel job example:

ossio[[p]|[t]] "mpirun -np 128 IOR"

Additional arguments:

**default:** trace all I/O functions

< f t list>: Comma-separated list of I/O functions to trace, one or more of the following: close, creat, creat64, dup, dup2, lseek, lseek64, open, open64, pipe, pread, pread64, pwrite, pwrite64, read, ready, write, and writev

#### ossmem\*\*: Memory Analysis Experiments

ossmem "<command><args>" [ default | f t list ]

Sequential job example:

ossmem "smg2000 -n 50 50 50"

Parallel job example:

**ossmem** "mpirun –np 128 smg2000 –n 50 50 50"

Additional arguments:

**default:** trace all memory functions

< f t list>: Comma-separated list of memory functions to trace, one or more of the following: malloc, free, memalign, posix mem align, calloc and realloc

## osspthreads: POSIX Thread Analysis Experiments

osspthreads"<command><args>" [default | f t list]

Sequential job example:

osspthreads "smg2000 -n 50 50 50"

Parallel job example:

osspthreads "mpirun —np 128 smq2000 —n 50 50 50"

Additional arguments:

**default:** trace all POSIX thread functions

< f t list>: Comma-separated list of POSIX thread functions to trace, one or more of the following: pthreads create, pthreads mutex init, pthreads mutex destroy, pthreads mutex lock, pthreads mutex trylock, pthreads mutex unlock, pthreads cond init, pthreads cond destroy,

pthreads cond signal, pthreads cond broadcast, pthreads cond wait,

and pthreads cond timedwait

## ossmpi, ossmpip, ossmpit: MPI Experiments

ossmpi[p][t] "<mpirun><mpiargs><command><args>" [ default | f\_t\_list ] Parallel job example: **ossmpi[p][t]** "mpirun –np 128 smg2000 –n 50 50 50"

Additional arguments: **default:** trace all MPI functions

<f\_t\_list>: Comma-separated list of MPI functions to trace, consisting of zero or more of:

**MPI\_Allgather**, .... **MPI\_Waitsome** and/or zero or more of the MPI group categories:

**MPI Category Argument** All MPI Functions

**Collective Communicators** collective com **Persistent Communicators** persistent\_com Synchronous Point to Point synchronous\_p2p **Asynchronous Point to Point** asynchronous\_p2p process\_topologies **Process Topologies** graphs\_contexts\_comms **Groups Contexts Communicators** environment

Environment Datatypes datatypes File I/O file io

## **■** osscuda\*: NVIDIA CUDA Experiment

osscuda "<command> < args>"

Sequential job example: **osscuda** "eigenvalues --matrix-size=4096"

Parallel job example: **osscuda** "mpirun -np 64 -npernode 1 lmp linux -sf qpu < in.lj"

#### omptp: OpenMP Experiment

ossomptp "<command><args>"

Sequential job example: ossomptp "./lulesh2.0.3"

Parallel job example: ossomptp "mpirun -np 27 ./lulesh2.0.3"

- \* CBTF mode only, not available when using the offline mode. See MODES OF OPERATION section.
- \*\* The memory experiment performance data is not reduced in the manner that it is in the default mode of operation because the filters are not called during offline mode of operation.

#### **■ KEY ENVIRONMENT VARIABLES**

#### ■ OPENSS RAWDATA DIR (offline mode only)

Used on cluster systems where a /tmp file system is unique on each node. It specifies the location of a shared file system path which is required for OISS to save the "raw" data files on distributed systems.

**OPENSS RAWDATA DIR**="shared file system path"

Example: export **OPENSS RAWDATA DIR**=/lustre4/fsys/userid

## OPENSS MPI IMPLEMENTATION

Specifies the MPI implementation in use by the application; only needed for the mpi, mpit, and mpiotf experiments. These are the currently supported MPI implementations: openmpi, lampi, mpich, mpich2, mpt, lam, mvapich, myapich2. For Cray, IBM, Intel, SGI MPT MPI implementations, use mpich.

**OPENSS MPI IMPLEMENTATION**="MPI implementation, name"

Example: export **OPENSS MPI IMPLEMENTATION**=openmpi

In most cases, OISS can auto-detect the MPI in use.

#### OPENSS DB DIR

Specifies the path to where OISS will build the database file. On a file system without file locking enabled, the SQLite component cannot create the database file. This variable is used to specify a path to a file system with locking enabled for the database file creation. This usually occurs on lustre file systems that don't have locking enabled.

**OPENSS DB DIR**="file system path"

Example: export **OPENSS\_DB\_DIR**=/opt/filesys/userid

#### **OPENSS ENABLE MPI PCONTROL**

Activates the MPI Prontrol function recognition, otherwise MPI Prontrol function calls will be ignored by OISS.

#### OPENSS DEFER VIEW

Allow overriding the displaying of the default view for cases where users may not want or need it to be displayed.

#### ■ INTERACTIVE COMMAND LINE USAGE

#### ■ Simple Usage to Create, Run, View Data

The CLI can be used to run experiments interactively. To invoke OISS in interactive mode use: openss -cli An experiment can be created, run and viewed with three simple commands, e.g.:

expcreate -f "mexe 2000" pcsamp

expgo

expview

#### CLI Commands for Other Views

These interactive CLI commands may be used to view the performance data in alternative ways once an experiment has been run and the database file exists. The command: **openss -cli -f** <database-filename> loads the performance experiment. Then, the following commands may be used to view the performance information:

**help** or **help commands**: display CLI help text

**expview**: show the default view

**expview –v statements** : time-consuming statements **expview –v linkedobjects** : time spent in libraries expview -v calltrees, fullstack: all call paths

**expview –m loadbalance**: see load balance across ranks/threads/processes

**expview** -**r** <**rank\_num**>: see data for specific rank(s)

**expcompare -r 1 -r 2 -m time**: compare rank 1 to rank 2 for metric equal time

**list –v metrics**: see optional performance data metrics **list** –v src: see source files associated with experiment list -v obj : see object files associated with experiment **list –v ranks**: see ranks associated with experiment list -v hosts: see machines associated with experiment

**list –v savedviews**: list the views that have been saved for immediate redisplay

**expview -m** <metric from above> : see metric specified

**expview –v calltrees, fullstack** <experiment type> <number> : see expensive call paths.

For example: expview –v calltrees, fullstack usertime2

shows the top two call paths in execution time.

**expview** < experiment-name > < number > shows the top time-consuming functions. For example: **expview** 

**pcsamp2**: shows the two functions taking the most time.

**expview –v statements** <experiment-name><number>: shows the top time-consuming

statements. For example: expview -v statements pcsamp2: shows the two statements taking the most time.

For more information about the Command Line Interface commands please consult the OISS Users Guide: https://www.openspeedshop.org/documentation

#### **■ GRAPHICAL USER INTERFACE USAGE**

The GUI can be used to run experiments or to view and/or compare previously created performance database files. The two main commands used to invoke the GUI are:

**openss:** Open the GUI in wizard mode.

openss – f database file.openss: open a previously created file. These commonly used commands are described in the sections below.

#### **■ GUI Source Panel**

The Source Panel displays the source used in creating the program that was run during the O|SS experiment. The source is annotated with performance information gathered while the experiment was run. Users can focus the source panel to the point of the performance bottleneck by clicking on the performance information displayed in the Statistics Panel. In order to see per statement statistics, build the application to be monitored with -q enabled.

#### **■ GUI Statistics Panel**

per Function

The GUI can also be used to directly view performance data from a previous experiment by opening its database file. For example: **openss –f smg2000.pcsamp.openss** 

The GUI Statistics Panel view relates the performance data to the corresponding application source code. Clicking on an entry in the performance data panel focuses the source panel on the function or statement corresponding to the performance item.

The Statistics Panel toolbar icons allow alternative views of the performance data, and also built-in analysis views, e.q., load balance and outlier detection using cluster analysis. To aid in the selection of alternative views, a toolbar with icons corresponding to the views is provided. The icons are colored coded: where light blue icons relate to information about the experiment, purple for general display options, green for optional view types, and dark blue for analysis view options.

## 

Show the metadata information such as the experiment type, processes, ranks, threads, hosts I: Information

**U**: Update Update the display with performance information from the database file.

**CL:** Clear Auxiliary If the user has chosen to view a time segment, a specific rank/process/thread, or a specific function's data, then when the CL icon is selected, it will clear those settings so that the next

view is reset to show data with the original, initial settings.

D: Default Show default performance results. First use View and Display Choice buttons to select whether

data corresponds to functions, statements, or linked objects then click D-icon.

**S, down arrow:** Show performance results for the source statements for the selected function. Statement results

Highlight a function before clicking this icon.

C+: Call Path Show all call paths, including duplicates, in their entirety. Full Stacks

**C+, down arrow:** Show all call paths for the selected function only. Highlight a function before clicking this Call Path Full icon. All call paths will be shown in their entirety.

Stacks Per Function

**HC:** Hot Call Path Show the call path in the application that took the most time.

**B:** Butterfly View Show a butterfly view: the callers and callees of the selected function. Highlight a function

before clicking this icon.

**TS:** Time Segment Show a portion of the performance data results in a selected time segment.

**OV:** Optional View Select which performance metrics to show in the new performance data report. Selection

LB: Load Balance Show the load balance view: min, max and average performance values. Only used with threaded or multi-process applications.

**CA:** Comparative Show the result of a cluster analysis algorithm run against the threaded or multi-process Analysis View performance analysis results. The purpose is to find outlying threads or processes and report

groups of like performing threads, processes or ranks. CC: Custom Allow the user to create custom views of performance analysis results.

#### ■ GUI Manage Processes Panel

The Manage Processes panel allows focusing on a specific rank, process, or thread or to create process groups and view a group's corresponding data.

#### GUI General Panel Info

Each view has a set of panel manipulation icons to split the panel vertically or horizontally or remove the panel from the GUI. The icon toolbar found on far right of GUI panels is shown below.

Comparison View

View

#### ■ CONDITIONAL DATA GATHERING

Gather performance data for code sections by bracketing your code with MPI\_Pcontrol calls. MPI\_Pcontrol (1) enables gathering. MPI Pcontrol (0) disables. OPENSS ENABLE MPI PCONTROL must be set.

## ■ BLUE GENE AND CRAY STATIC APPLICATION USAGE

On the Cray and Blue Gene platforms, support of applications created with -dynamic is through the default workflow. That is, use the convenience scripts to gather the performance data and the GUI and CLI to view it. Please use the target runtime environment (module/dotkit) files while gathering and the host/frontend module/dotkit files to view the data. OISS provides an **osslink** script to add into the application make files to help minimize the impact of the application link step.

## Makefile Modification Example

Duplicate and edit this general makefile target: \$(TARGET): \$(OBJ)

\$(F90) -o \$@ \$(FFLAGS) \$(OBJ) \$(LDFLAGS) To create a pcsamp experiment: (changes in bold)

oss-pcsamp: \$(0BJ)

osslink -c pcsamp \$(F90) -o \$(TARGET)-pcsamp \$(FFLAGS) \$(OBJ) \$(LDFLAGS)

#### Running ossutil to Create O|SS Database File (offline mode only)

Set **OPENSS\_RAWDATA\_DIR** prior to application execution.

After the application completes use this command to create the OISS database file: **ossutil** < raw data directory path>.

After the above step, the database file may be viewed like any other O|SS database file.

For more information, please visit https://www.openspeedshop.org/documentation
